STRATEGIC OVERVIEW

1. Traffic Snapshot

This packet capture ran for **30.21 seconds**. During this period, **0.00 KB** of data was captured, resulting in an average throughput of **0.00 bps**.

Verdict: This indicates a complete absence of network activity during the capture window. Therefore, it reflects neither 'High Load' nor 'Background Activity', but rather an **idle or inactive state** for the target device.

2. Protocol Composition

No protocol data was observed during the capture period.

PROTOCOL	FRAME COUNT	BYTES	% OF TRAFFIC
(No Data)	(No Data)	(No Data)	(No Data)

Explanation: The lack of any protocol data indicates that no network traffic traversed the monitored interface during the capture duration.

3. Connection Analysis

No active conversations were detected during the capture window.

Analysis: As no conversation data is available, it is not possible to identify any external vs. internal IP connections or flag any suspicious

destination ports. The target device did not establish any network connections during the observation period.

4. Automated Security Insights

The automated tool's verdict states: **"No anomalies."**

Observation: Given that no traffic was captured, there is no presence of unencrypted traffic (HTTP/DNS) to be concerned about. The absence of any traffic naturally leads to a "no anomalies" verdict, as there's nothing to analyze for potential issues.
