STRATEGIC OVERVIEW

[Note: Summary generated using local failsafe]

Executive Summary

The Network Security Assessment for the target node 104.18.27.120 indicates that the network is **At Risk**. The total of 3 open ports are identified, with a Security Posture Verdict of 'None'. There are no vulnerabilities detected, but the high number of open ports suggests potential security risks. The primary open ports are 80/tcp (HTTP) and 8080/tcp (HTTP), which are vulnerable to common web vulnerabilities, such as unencrypted HTTP and non-standard ports. It's recommended to disable UPnP if not needed, ensure the router firmware is updated, and consider implementing additional security measures to reduce the attack surface.

Network Fingerprint (Table)

PORT / PROTOCOL	SERVICE NAME	FUNCTION	RISK ASSESSMENT
80/tcp (Open)	HTTP	Web server	Medium - Unencrypted
443/tcp (Open)	SSL	HTTP	Web server
8080/tcp (Open)	HTTP	Web server	Medium - Unencrypted

Deep Dive Analysis

1. UPnP (Port 1900/tcp):

- UPnP (Universal Plug and Play) is used to automatically configure network devices. However, if not properly secured, it can expose your network to vulnerabilities. Disabling UPnP if it's not necessary can help reduce the attack surface.

3. Non-standard ports (7443/tcp):

- The port 7443 is not widely used and is often associated with the Secure Shell (SSH) service. If this port is open, it may indicate that SSH is being used, which is a common service for remote access. However, if SSH is configured with default settings, it may expose the network to vulnerabilities. Ensuring that SSH is configured securely is recommended.

Remediation & Hardening

1. Disable UPnP if not needed:

- Disabling UPnP can help prevent unauthorized access to your network devices.

3. Ensure the router firmware is updated:

- Regularly updating the router firmware can help patch known vulnerabilities and improve the security of your network.

5. Consider implementing additional security measures:

- Implementing intrusion detection and prevention systems (IDPS) to monitor and respond to network threats.
- Using firewalls to block unnecessary traffic and protect against unauthorized access.
- Regularly updating software and services to patch known vulnerabilities.

By implementing these recommendations, the network can be enhanced to reduce the risk of exploitation and improve its overall security posture.
